

Reading the Admin Overview Dashboard

OomniEye · Administrator reference

1. Purpose of the overview

The overview summarises the health of the help system in one screen: how much content exists, how much is waiting for approval, how many support requests are open and where coverage gaps remain.

2. Help management cards

- Total resources — every article regardless of state.
- Pending approval — submitted by help admins, not yet visible to customers.
- Archived — retained but hidden from customers.
- Coverage — registered contexts with at least one approved article.

3. Ticket cards

Ticket cards mirror the ticket statuses. A rising pending count with a flat resolved count usually indicates a triage backlog rather than a product problem.

4. Status colouring

- Green — healthy, no action required.
- Amber — attention needed within the working week.
- Red — action required now.

5. Content library

The library lists every article with its author, context, type and state. Approve publishes an article to customers immediately; archive hides it without deleting it.

6. Coverage tab

Coverage lists every registered context and the count of approved articles attached to it. Prioritise gaps on tables, search fields and filters — these attract the most help requests.

7. Operating rhythm

- Clear the pending approval queue daily.
- Review coverage gaps weekly.
- Archive superseded content rather than deleting it.
