

Advanced Filtering Operators

OomniEye · Filtering reference for tables and libraries

1. Filter model

Every filter in the workspace resolves to a set of predicates combined with AND. Selecting multiple values inside a single filter group combines them with OR, so a type filter of Video plus PDF returns both.

2. Date filters

Date filters accept either a rolling window or an explicit range. Rolling windows are re-evaluated on every load, so a saved view stays current.

- Last 7 / 30 / 90 days — rolling windows.
- Custom range — inclusive of both boundary dates.
- Arrow controls step the active window backwards or forwards.

3. Combining filters

Filters compose with search. The search term is applied last, over the already filtered set. Clearing filters does not clear search and vice versa.

4. Saved views

A filter combination can be saved as a named view. Saved views store the filter predicates, not the resulting rows, so they stay accurate as new data arrives.

5. Performance notes

Filters are evaluated client-side for sets below ten thousand rows and server-side above that threshold. Behaviour is identical; only the evaluation location changes.

6. Reference table

- equals — exact match, case-insensitive.
- contains — partial match anywhere in the value.
- between — inclusive numeric or date range.
- in — value matches any of the selected options.
