

Raising an Effective Support Ticket

OomniEye · Support process guide for customers

1. Before you raise a ticket

Check the help panel for the component you are working with. A large share of incoming requests are already answered by an existing article.

2. Writing the subject

The subject should identify the component and the symptom in one line, for example: Site Recordings table — duration column shows zero for all rows.

3. Writing the description

- State what you expected to happen.
- State what actually happened.
- List the exact steps that reproduce the issue.
- Include the date and time you observed it.

4. Choosing a priority

- Low — cosmetic or a question.
- Medium — a feature is awkward but usable.
- High — a workflow is blocked for you.
- Urgent — a workflow is blocked for your whole team.

5. Attachments

A screenshot of the failing screen resolves most tickets a full cycle faster. Attach at most two files; keep them under ten megabytes each.

6. What happens next

Tickets are acknowledged and move to Under Review once an engineer picks them up. You are notified on every status change, and the resolution is recorded on the ticket for future reference.
